

Charlie's Droop Adjuster

It's not uncommon to find an airgun with barrel droop. Especially one from China Town. I'm sure every one has read about how you place a rifle barrel between two chairs and take a 4X4 piece of wood about 3 or 4 feet long and beat it into alignment. If you haven't, don't laugh. That is how some of the premier gunsmiths do it. And it does work. Now me, I just ain't got the heart to do that to my guns. Scares me too.

See here a simple device to bend the barrel as little or as much as needed. It is nothing more than a bridge device that you can draw the barrel down to adjust it. I notched it to fit my guns. Just notch to meet your needs. When adjusting, draw it down and let it set for a couple of minutes prior to releasing the pressure. Make small adjustments until it meets your satisfaction. This is pictured with a piece of construction rebar substituted for a barrel for demonstration purposes. The black thing is a piece of rubber to place under the eye bolt to prevent scratching the barrel.

In this case I used a larger than needed eye bolt, cuz that's what I had. If ya don't like it, throw it out.

Thanks fellas

Charlie
